

MUSHROOMS IN THE LAWN

- Mushrooms are usually a good sign for your lawn. They decompose organic matter and release nutrients into the soil. However, they can also indicate that your lawn is overwatered or has poor drainage.

TO REDUCE MUSHROOMS, YOU CAN TRY THESE TIPS:

- **Improve Soil Drainage:** We recommend aerating your lawn to enhance drainage and prevent water from pooling in low areas.
- **Adjust Watering Practices:** It's best to water deeply but less frequently to avoid over-saturation. Aim for about 1 inch of water per week, including rainfall.
- **Clear Debris:** Regularly remove fallen leaves, grass clippings, and other organic matter to limit the food source for mushrooms.
- **Maintain Grass Height:** Mow your lawn at the recommended height for your grass type, as taller grass tends to retain more moisture.
- **Consider Fungicide:** If mushrooms continue to be a problem, we can help you assess the need for applying a fungicide and determine the best option for your lawn.
